Protect you & your clients from ground stability risks

The effects of global warming and continued sporadic rainfall have led to a dramatic rise in subsidence cases across the UK. Last year 40,000 claims were submitted to insurers - that's 1 in 500 houses with a problem. In an event year when soils are starved of moisture, 75% of claims are attributable to the influence of trees and clay soils. In certain postcodes the threat of subsidence can be as high as 1 in 250.

In addition to natural subsidence issues, cavernous holes have opened up on previously leafy, suburban streets as previously unknown mines have been discovered, emphasising the fact that issues of ground stability are by no means limited to traditional mining areas. There have been a number of well publicised cases of land and house collapses, with recent examples including past chalk mining which affected 2,000 homeowners in Reading, Berkshire and a school closure in Hatfield, Hertfordshire. High profile media coverage of subsidence-affected properties continues to offer a timely reminder to practitioners of the importance of ground stability risk. Additionally, there is now an increasing onus on legal professionals to keep their clients informed. Do you have the correct due diligence information to ensure your clients are protected?

Ensure your clients are protected

Recent research by Central Law Training found that 95% of homeowners rated the provision of information on the risk of subsidence as important. Research by Woolwich Building Society found that 78% of home buyers identified subsidence as one of the major concerns in any property transaction.

The Homecheck Professional Ground Stability report represents the first widely available information covering all minerals mining in the UK in one simple report and offers a valuable screening tool to verify potential risks. In addition to information on mining, the report also includes risk assessment on a range of other ground stability issues covering 17 datasets.

Data backed up by independent leading environmental consultants

The Homecheck Professional Ground Stability Report is unrivalled in terms of detail and available data. Produced in conjunction with Wardell Armstrong, one of the UK's leading mineral and engineering consultants, the report is the first to screen for an extensive range of mineral mining and other causes of ground instability.

Key features & benefits

- **British Geological Survey (BGS) subsidence data:** Providing valuable information on natural subsidence risk surrounding your client’s property, particularly useful where the homebuyer is moving to an unfamiliar area.

- **Comprehensive mining data:** Identification of 2,270 mines dating back to the late 1700’s, unique to Homecheck Professional.

- **Detailed data screening:** Information on a range of potential stability issues based on a total of 17 datasets ensuring peace of mind for both you and your client.

- **Summary of associated risk:** A clear overall assessment of the likelihood, based on the data within the report, that the property is likely to be affected by ground stability issues.

- **Professionally endorsed:** Data supplied by Wardell Armstrong, a leading UK mineral and engineering consultancy.

- **Expert referral service:** If risks uncovered in the report require further investigation, our expert partners can offer a range of additional advice and services.  

---

**Did you know, we also provide in-house environmental, flood and planning CPD training and Product Briefings?** Our CPD training sessions provide a clear and concise summary of the legal framework impacting conveyancers in respect of environmental and planning risk. In addition, our free expert Product Briefings explain how different products within the Homecheck Professional range can add value to the conveyancing process, protecting both you and your clients from potential risk.
